Exercise Report: GPT-4 Chatbot for OrderBot

Objective:

The exercise aimed to create different versions of an order-taking chatbot, “OrderBot,” to assist customers in placing pizza orders. Each version was designed to test how well GPT-4 responds to varied instructions, conversation styles, and order formats.

Version 1: Standard Pizzeria OrderBot

This version mimicked a traditional pizzeria system, collecting orders for pizza type, size, toppings, drinks, and sides.

Key Features:

- **Menu Options:** Traditional pizzas (e.g., pepperoni, cheese, veggie).
- **Order Flow:** Standard sequence for pizza, toppings, drinks, and sides.
- **Responses:** Short and concise, gathering necessary information.

Outcome:

- **Successes:** Smooth operation, effective order gathering, and clear summary.
- **Challenges:** Sometimes assumed default sizes for pizza or drinks, leading to confusion.

Version 2: Space-Themed GalacticOrderBot

A creative, space-themed version with playful names and tone, such as “Meteorite Pizza” and “Galactic Soda.”

Key Features:

- **Menu Options:** Fun names and prices based on a space theme.
- **Tone:** Playful, with phrases like “Let’s blast off to your order!”
- **Responses:** Whimsical and engaging.

Outcome:

- **Successes:** Fun interaction, engaging users with creative responses.
- **Challenges:** Ambiguity in drink sizes and formatting responses; occasionally too creative, leading to confusion.

Version 3: Mystery Pizza OrderBot

This version introduced surprise elements, where users describe their pizza preferences, and the bot creates a random "mystery pizza."

Key Features:

- **Menu Options:** User inputs, then a surprise pizza is generated.
- **Tone:** Mysterious, asking users about their "pizza mood."
- **Responses:** Surprise pizza based on inputs, with random toppings and drinks.

Outcome:

- **Successes:** Unique, fun experience; users were excited about the surprises.
- **Challenges:** Sometimes "hallucinated" random items (e.g., "alien mushrooms"), leading to confusion.

Conclusion:
While creativity in chatbot design can enhance user engagement, clear communication and structured interactions are essential. Creative approaches must ensure that users are in control and avoid overwhelming them with surprises. A balanced approach between fun and clarity leads to the best user experience.
